

Our group will be using Trello to keep track of all our tasks, as well as who is doing what. Our Trello contains three boards so far. One is an outline of our groups four sprints. This is used to keep track of what our long term plan is. The main board we will be interacting with is the current tasks board. It contains a list of our long term to do's, and a list of what each person is tasked with working on currently, and what they recently completed. The third board is for us to document our ideas and keep rough outlines of what we want to do, in a shareable manner.

For our project, we plan to have four separate sprints. For the first sprint, everyone was tasked with researching a specific aspect of the project and planning how they will work on it. As we plan on working in an Agile methodology, different groups will be tasked with various assignments that will need to change and evolve with each other. For example, part of our project involves creating an input form in HTML and submitting the data to a database. The requirements of this form will grow and evolve with the needs of the group tasked with creating the database, and the database's requirements will change with the group tasked with manipulating the database. As our entire group will be working on interconnected aspects at the same time, good communication is key, in order to combine our efforts and create a working app. The second sprint is characterized by creating skeletons for how everything will work. This sprint is centered around creating all the necessary parts for our app, and syncing them together. The third sprint, is adding the necessary details and body to the project. This involves adding the specifics that we require of our project to make it a unique app and complete its purpose. The final sprint involves adding extra details and enhancements in the project that we have found necessary and feel would enhance the project along the way.

Our task assignments start out being on mainly an individual basis, but once we have a start, tasks can merge as shown in the board and below. The order of precedence on tasks is shown below.

Aside from our sprint outline, we will be using a Kanban method of organization within each sprint. Each group member has a list of tasks assigned to them, many need to be completed in a specific order. When they are done with the task, they move it into the done section and move

onto their next to-do. Throughout the process, as we discover more aspects to our assignments, we create new to-dos and prioritize them as needed. Our current list is linked below and shown.
